

Washmaster INSTRUCTIONS

1. Fill the tank with 15 gal fresh water.
2. Add Washmaster Juice - 1 bottle (12oz) treats 15 gal.
3. Place the intake screen on the hook with the screen 2-4" under water.
4. Plug into 110 electric outlet. Turn switch on.
5. Pull the trigger on the water pistol to wash tools.
6. Wash tools until mud and debris is 10-12" deep in the bottom of the tank.
7. Place a clean bucket next to the washer.
8. Spray water into the bucket while removing the screen intake from the hook.
9. Continue to spray water into the clean bucket. Slowly moving the screened intake hose in a circular motion, lowering the screen, stirring into the settled mud (this pumps the mud into the bucket). While continuously spraying, raise the screen back to the hook. Continue spraying 5 seconds to clear the system.
10. After the mud has settled in the bucket, pour the clear water back into the tank. Reuse the mud to mix.
11. Drain the debris from the valve at the bottom of the tank into an empty box and bag to discard.
12. When water ceases to clear or once daily, drain the tank and recharge with fresh water and Washmaster Juice. You can use the drained water for other related uses (washing and mixing).
